

Case Study: SCRAP-IT

Company Profile

SCRAP-IT is a voluntary, early vehicle retirement program that provides incentives to British Columbians who choose to replace higher polluting vehicles with cleaner forms of transportation. When the program started in 2008, a new IT infrastructure was put in place. However, as the program rapidly grew and more and more British Columbians began retiring their old cars as a result, it became evident that certain changes were going to be required.

The Challenge

Building a completely redundant system wasn't a project that SCRAP-IT was prepared to take on. Spending the time, resources and money to build the infrastructure required was simply not something management had an appetite for.

The Solution

Having worked with our team for two years at that point, SCRAP-IT turned to us for some practical advice. Since Dyrand knew their business model and understood their requirements, we could see that the solution was already available through a combination of hosting and on-site systems.

The Results

The result proved to be exactly what SCRAP-IT required. Their systems have been stable and running efficiently since the migration, and there are no longer any worries about how the company will run in the event of a disaster. The team at SCRAP-IT can now focus their time and energy on continuing to reduce greenhouse gas emissions and lowering exhaust pollutants across the province, and Dyrand is very proud to be making a contribution to such an important cause.
